

Silt Fence

Proud to be a Maryland Manufacturer

Silt Fence Structures

Silt fence structures composed of specially developed fabrics on supporting posts and are designed for efficient control of sediment run-off from construction sites. This sediment, left unchecked, can clog and pollute native waterways and damage natural areas. Controlling the run-off with silt fence is a major concern to environmentalists and is increasingly advantageous to owners, contractors and engineers who face the economic costs associated with site sediment loss. Installed correctly in the field, the sedimentation control fabric in silt fence structures functions as a filter and a run-off flow velocity check. fine-grain sediment is trapped, while storm water run-off may pass through at a moderate rate.

Prefabricated Silt Fence with Posts

Our silt fence with posts come pre-assembled as a unit, and is ready for immediate installation upon arrival at your site. The prefabricated system has several unique features and advantages:

- Completely prefabricated system
- Available in a variety of fabric types to meet specifications for adherence to governmental agencies' regulations
- Available in varying fabric heights
- Posts are available in different dimensions and spacing depending on the customers

Non-Assembled Silt Fence

Our non-assembled silt fence comes without posts attached and is ready for immediate installation upon arrival at your site with the customer attaching the stakes on site. The non-assembled system has several unique features and advantages:

- Able to have stakes attached in different intervals based on the job as required i.e. swales, checks, inlet boxes, ditches etc.
- Available in a variety of fabric types to meet specifications for adherence to governmental agencies' regulations
- Available in varying fabric heights and length
- Posts are available in different dimensions at an extra cost.
